

Presenting Design Work

Scott Klemmer

with materials from Forrest Glick

Quiz 4

- Do not start until we tell you
- Fill in Name & PID while waiting
- 10 Minutes:

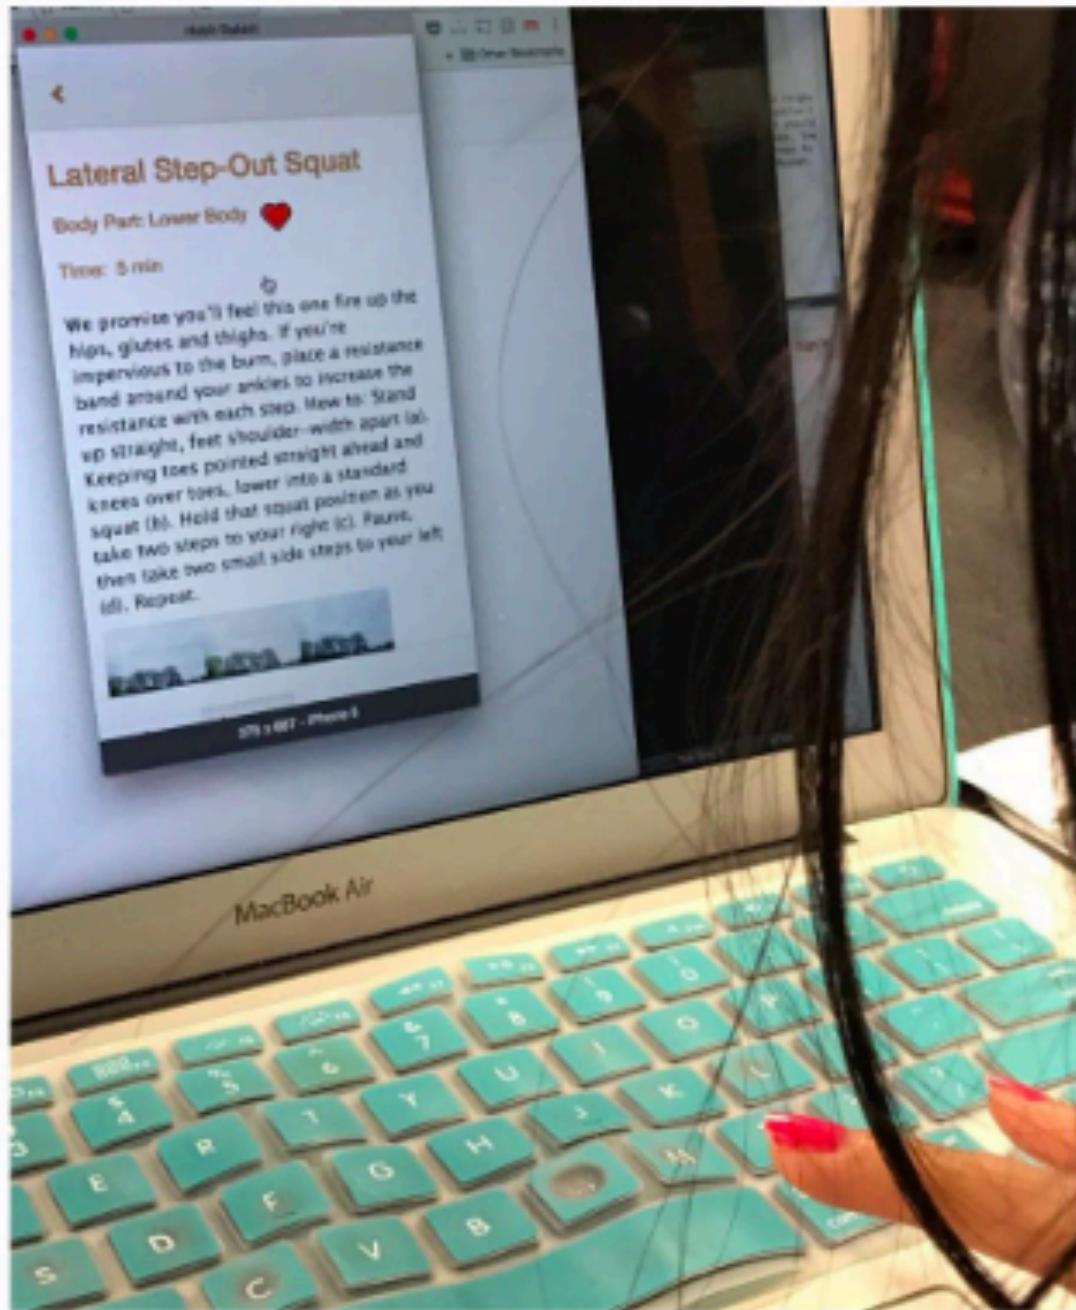

Your Presentation

- A 30-second spiel
- A slide for the background while you talk
- A poster - can be made from butcher paper
- A practiced in-person demo

A8 Examples

Alvin Mo, Christine Chang

She expresses that the individual exercises page has too much text and she is too lazy to read through them

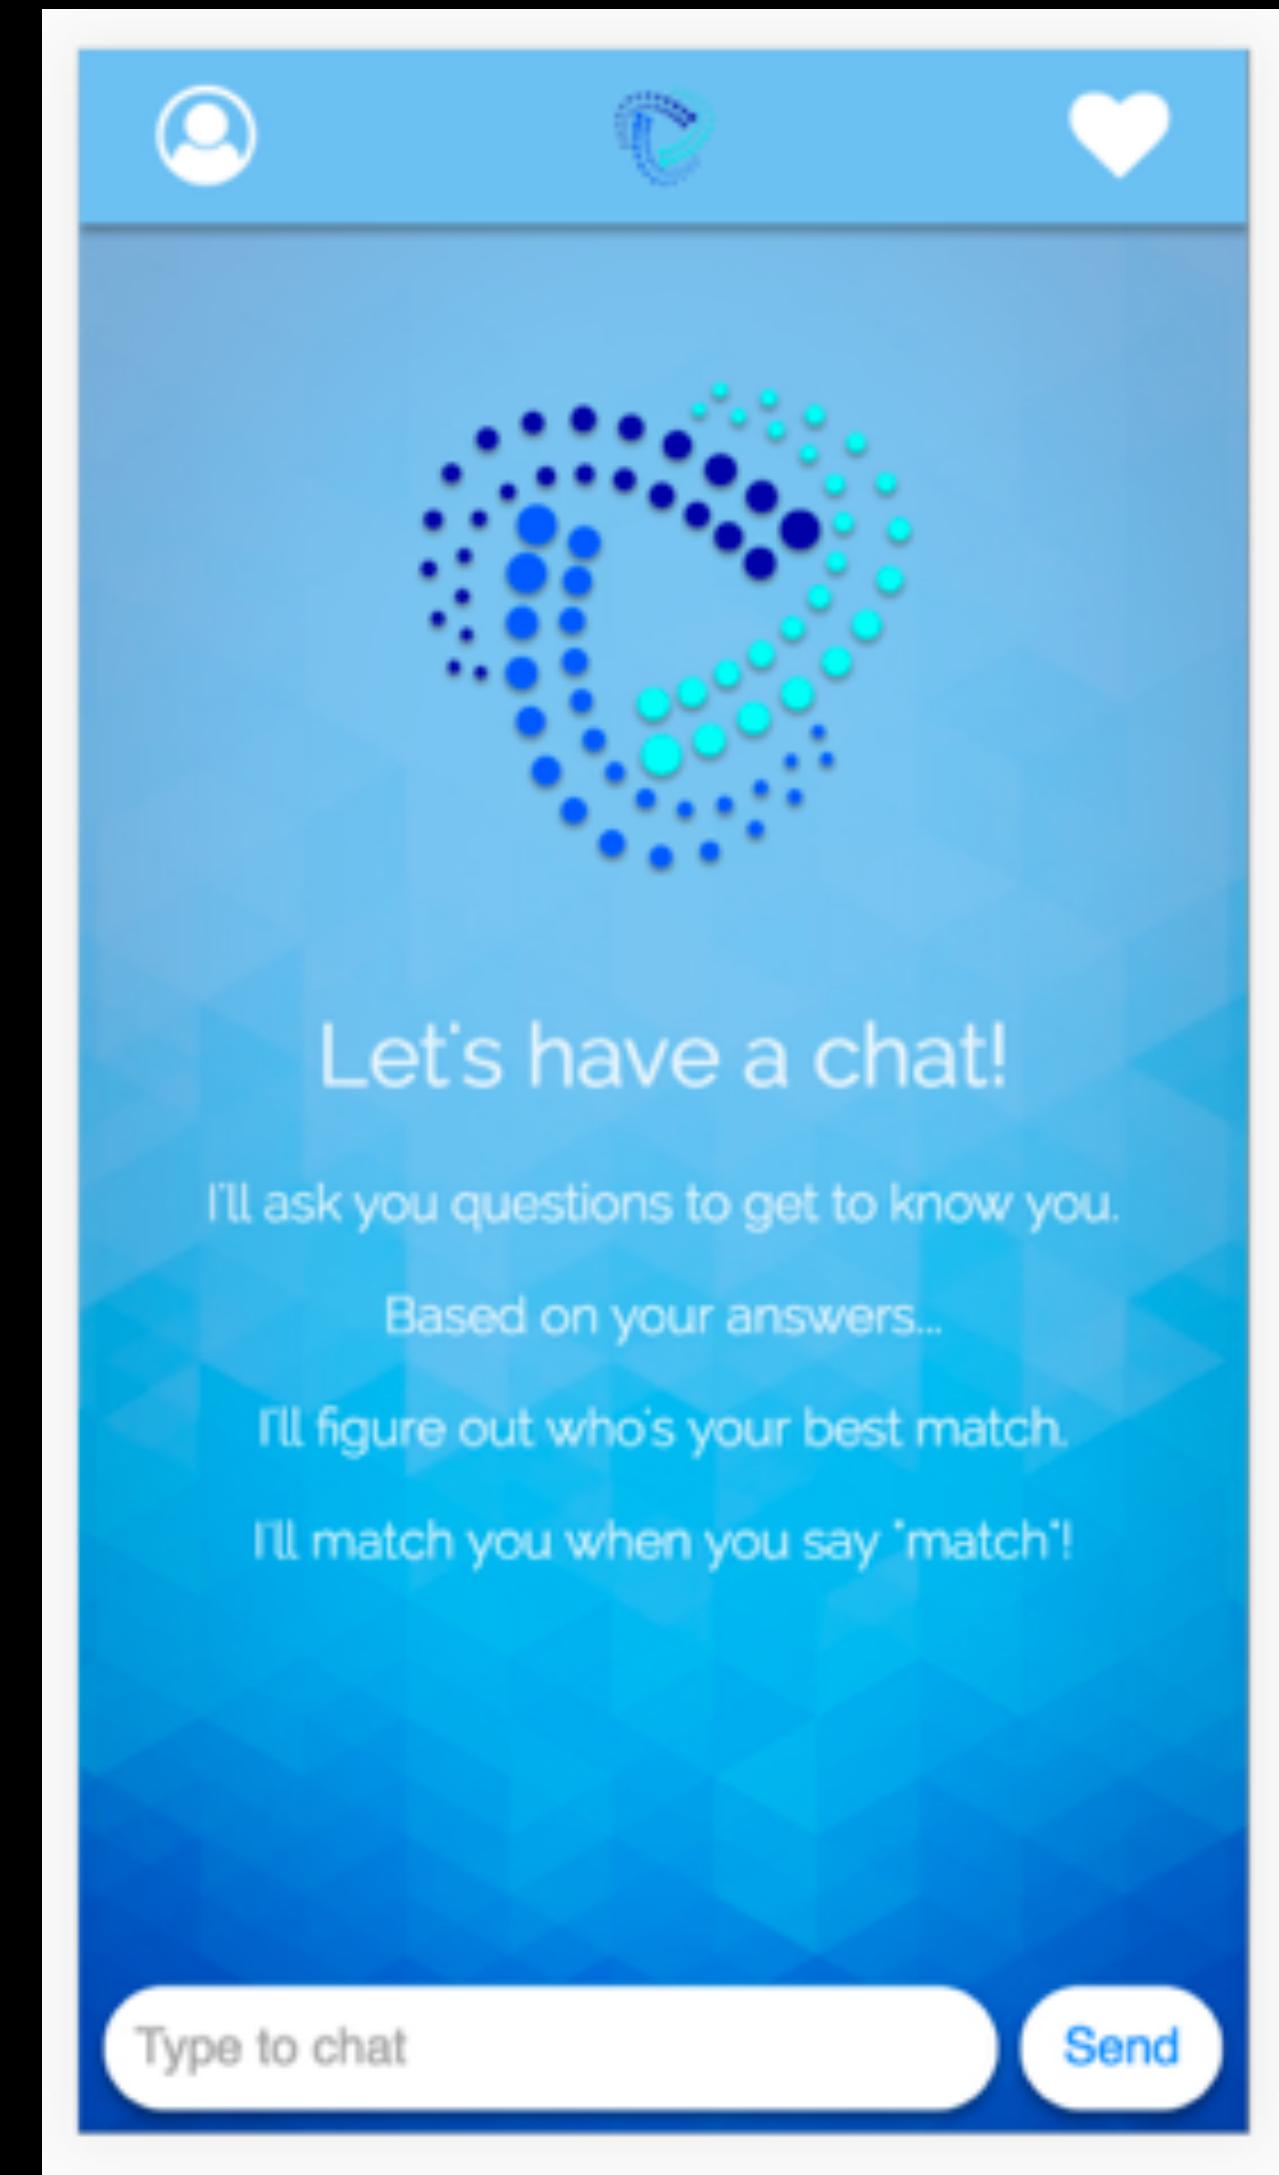

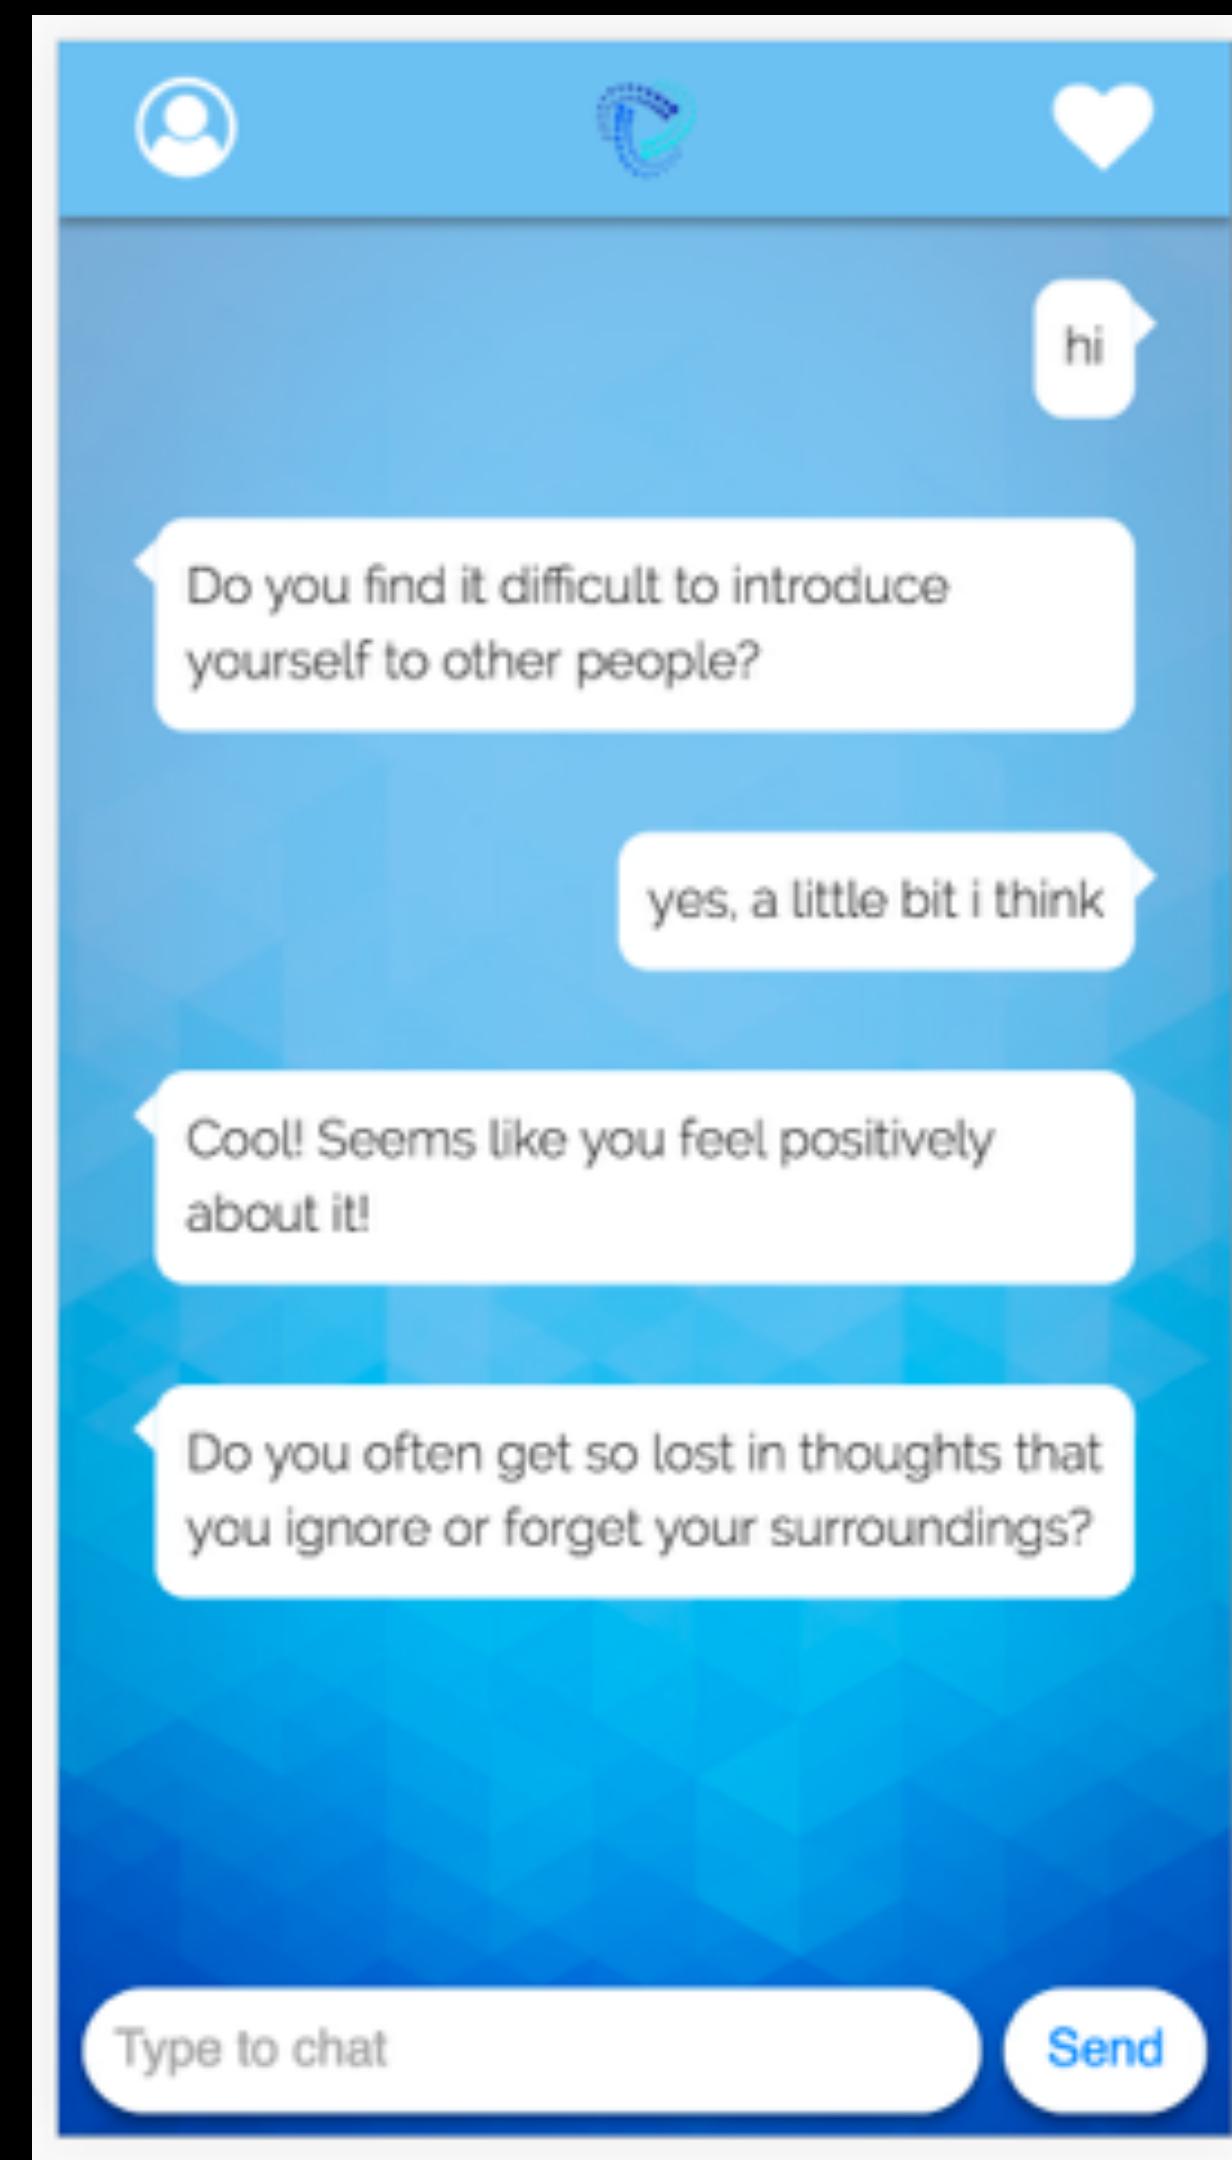

Observations :

- Moves through pages very quickly, glancing rather than reading
- When he did stop to read at the exercise page, it was because there was a exercise whose name was cut off because it was too long to fit, and he tried to mouse over to see the whole name
- Was confused to as why the heart in the exercise Page wasn't registering his clicks like the ones on exercise did.
- Was surprised to see the complete list of exercises when he clicked on exercises in the nav bar, rather than the selection of 3 for upper body he had seen previously

1 Drunks

A close-up photograph of a tree frog's head and front legs. The frog has large, bulging orange eyes with dark pupils. Its skin is a mottled reddish-brown color with darker, irregular spots and a slightly bumpy texture. It is gripping a dark, textured branch with its front legs. The background is blurred green foliage.

INSPIRATION

Eating healthy means solving three different problems:
Finding good recipes, buying the necessary ingredients,
and cooking.

There are many recipe-searching applications, but existing recipe solutions contain a large gap between the process of buying food and the process of making a meal. With the multitude of recipe websites, there isn't a shortage of good and healthy things to make - however, the gulf of execution is massive because of the means with which to remind oneself of those recipes once it is time to purchase the ingredients is very limited.

PROTOTYPING

Our application was developed over the course of two months using rapid prototyping and heuristic evaluation techniques. Initial iterations of the app were designed to recommend recipes based on what the individual has in his or her fridge.

At the early stage of the design process, we created three different designs on paper prototypes, and used heuristic evaluation to come up with one final version. This version had two different screens for the shopping list and the favorite recipes. Later, based

Our first paper prototypes included many ideas that were pruned and improved upon with heuristic evaluation.

The first UI theme. User testing led us to iterate frequently, and the current layout is the 4th version.

Inspires healthy COOKING & SHOPPING wherever you are

SOLUTION

LazyCook's smart algorithm suggests recipes based on your shopping behavior, and then keeps track of what you need to buy, so that your shopping list is always with you.

In order to solve the problem that busy individuals or college students would not be motivated enough to maintain an updated inventory of their fridge, LazyCook suggests recipes based on previously bought items. Over time, with more items purchased, the suggestion algorithm will become more intelligent in its recommendations.

USER TESTING

Clicking and tapping behavior is captured in this heatmap generated by tracking through CrazyEgg.

We obtained results from Google Analytics and CrazyEgg about general behavior. We also performed a within subjects test on 20 users comparing two different colored renderings of the app. Lastly, we performed a between-subjects test that evaluated, among other things, user feedback on first impressions ("what button would you press first") and what it did ("what does this app do").

What It Does

We aim to match nearby people on the basis that if they like the same things, they are more likely to get along. Users develop different lists of interests for different occasions, simply switching which lists are active based on the situation.

Prototyping

By creating prototypes and iterating based on feedback, we were able to quickly hone in on the best way to approach solving the need we found. Problems with confusing terminology and poor intuitive usability were fixed before a full product was even made.

Brainstorming

Needfinding:

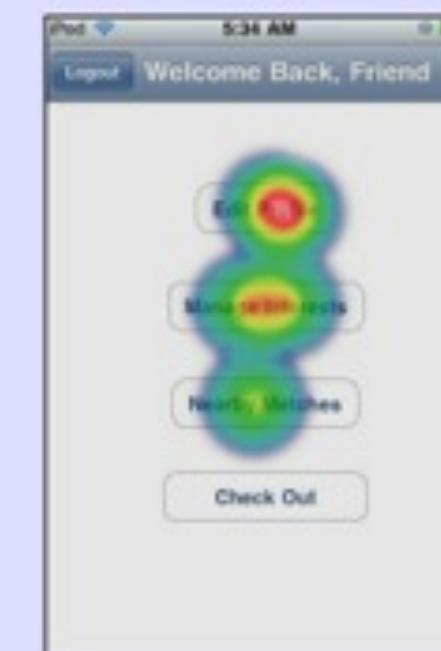

When you're looking for someone to talk to, how do you find someone you might get along with?

Discovery:

People enjoy spending time with others who share some of their interests

People look for different shared interests depending on what they're doing (work, mall, etc)

Testing

User testing allowed us to identify weaknesses in our design.

By evaluating these results, we were able to fix such problems, improving the application and solidifying the end user experience.

PARTYWHERE

FIND A PARTY NEAR ME.
